

4 Conclusions and future work

In this paper, a methodology for modeling software requirements of AmI applications is presented. This methodology consists of five models. In phase 1 we captured part of the context sensitivity with the business modeling. In phase 2 we captured part of the context sensitivity defining the environments in addition to capture the intelligence with the tasks and goals. In phase 3 we capture the ubiquity defining the technological elements of communication and also we capture the natural interaction with the actor associations indicating the type of interaction, the phase 5 show us overview of goals of the application. The results on the validation of our approach with the case study showed better clarity in the specification of the interaction between the user and the system. In addition to a concrete definition of the objectives and goals of the analysts. Currently, we are working on refining our proposed methodology for validating the identification of all elements of an AmI application. For to do this, we are working in several case studies reals of AmI applications.
