Interpolation for Query Reformulation
(Abstract of Invited Talk)

Michael Benedikt
Department of Computer Science, University of Oxford, UK

In this talk I will explain query reformulation problems – given a formula $Q$ and a background theory $\Sigma$, the goal is to translate $Q$, either into another formula or a direct implementation, such that the translation is equivalent to $Q$ according to $\Sigma$, and such that the translation satisfies additional interface restrictions – e.g. restrictions on the vocabulary. I will review the approach to solving these problems via interpolation which has been investigated by several groups of researchers over the last few years, presenting the properties of a proof system and interpolation algorithm we might desire for the application to reformulation. I will then give a quick tour of some proof methods and associated interpolation methods proposed in the past, with some tentative remarks about how these stack up against the requirements.
