Appendix – Results for 2003 Campaign

The following pages contain the results for all valid experiments for the multilingual-4, multilingual-8, bilingual, monolingual and GIRT tasks that were officially submitted to the organizers for the CLEF 2003 campaign. Results for the interactive track, question answering, spoken document retrieval, and image retrieval are presented elsewhere.

The first four pages give a listing of all runs and their characteristics:

Institution:	the name of the participant's organization responsible for the run
Country:	origin of participant's organization
Run Tag:	unique identifier for every experiment. Can be used to match individual result pages with this list.
Task:	which track/task the experiment is part of.
Topic language:	language of the topics used to create the experiment (ISO identifiers for language).
Topic fields:	identifies the parts of the topics used for query creation (combination of T=title, D=description and N=narrative).
Run Type:	type of experiment (automatic/manual).
Pool:	specifies if experiment was used for relevance assessment pooling.

The following ten pages compare the top entries for every track/task. Shown are the recall/precision curves for at most five groups. Chosen are the best entries by the respective groups, with the topic fields fixed to title+description (mandatory experiment for every participant) and only automatic experiments used. For the multilingual, bilingual to English, bilingual to Russian and GIRT experiments, the top entries regardless of topic language are presented.

The remainder of the pages is made up by the individual results for every official experiment. Each experiment is presented on one page, with the following details given:

1. A table providing the following information:
   - Average precision figures for every individual query. This allows comparison of system performance for single queries, which is important since variation of performance across queries is often very high and can be significant.
   - Overall statistics, giving:
     - the total number of documents retrieved by the system
     - the total number of overall relevant documents in the collection, and
     - the total number of relevant documents actually found by the system
     - interpolated precision averages at specific recall levels
     - non-interpolated average precision over all queries
     - precision numbers after inspecting a specific number of documents
     - R-precision: precision after the last relevant document was retrieved.
2. Two graphs consisting of:
   - a recall/precision graph, providing a plot of the precision values for various recall levels. This is the standard statistic and is the one most commonly reported in the literature.
   - a comparison to median performance. For each query, the difference in average precision, when compared to the median performance for the given task, is plotted. This graph gives valuable insight into which type of queries is handled well by different systems.

The results page for a specific experiment can be most quickly located by using the table of contents. This table is sorted by group, task, topic language and topic fields. The individual pages are sorted by task and run tag.

More information on the interpretation of the standard measures used for scoring experiments (average precision, recall levels, precision/recall graphs, etc.) can be found e.g. in:

Martin Braschler, Carol Peters: *CLEF 2002 Methodology and Metrics*, CLEF 2002 (Carol Peters, Martin Braschler, Julio Gonzalo, Michael Kluck (Eds.), Advances in Cross-Language Information Retrieval: Results of the CLEF 2002 Evaluation Campaign. Lecture Notes in Computer Science, Vol. 2785, Springer, 2003.
